GENESYS

CX Insights

Installation and Configuration Guide

Abstract

This document contains installation and configuration information for Pureconnect CX Insights, which provides real-time analytics dashboards.

For the latest version of this document, see the PureConnect Documentation Library at: http://help.genesys.com/pureconnect.

For copyright and trademark information, see https://help.genesys.com/pureconnect/desktop/copyright_and_trademark_information.htm.

What's New for CX Insights administrators?

For more information about the changes and enhancements in CX Insights for administrators, see the following:

2021 R3

- Added Custom status in CX Insights.
- Added Install MicroStrategy Developer with New License.
- DataSource Configuration.

2020 R4

PureConnect 2020 R4 introduced the following changes and enhancements in CX Insights for administrators.

Red Hat Enterprise Linux (RHEL) support

CX Insights now supports RHEL versions 7.6, 7.7, and 7.8 along with CentOS 7.0.

Automated Switchover

The CX Insights server now supports automatic switchover to the IC secondary server when the IC primary server fails.

Reverse proxy server using nginx

We have provided steps to configure nginx as a reverse proxy server.

For more information about configuring nginx as a reverse proxy server, see Configure reverse proxy using nginx.

CX Insights overview

CX Insights is a web-based application that allows you to display interactive dashboards to view and analyze real-time agent status and workgroup activity. Agent dashboard visualizations help you monitor agent status and agent interaction details in real time. Workgroup dashboard visualizations give supervisors a quick view of available agents and their current states. Each agent or supervisor requires an assigned Analytics Core User license to log in, and an access permission to use the dashboards. In addition, you can configure a user with an Analytics Designer license who can create and modify the dashboards for agents and supervisors. CX Insights is built on the MicroStrategy Business Intelligence (BI) platform that runs best in a Linux environment. It is deployed as Kubernetes through an Ansible playbook. The current support is only for SQL and not Oracle database. CX Insights can be accessed from Google Chrome, Mozilla Firefox, Internet Explorer, and Safari.

CX Insights architecture

CX Insights deployment model

CX Insights server

The CX Insights server is a Linux server that uses Kubernetes to run the containerized version of the MicroStrategy BI platform, and integration containers used for interfacing with PureConnect. The primary driver of the following resource requirements is the MicroStrategy BI platform. It uses in-memory cubes to model incoming real-time statistics for use by visualizations in dashboards.

CX Insights prerequisites

CX Insights requirements

You need Internet Connectivity while installing CX Insights, to download few packages and modules. After Installation is complete, Internet connectivity is not required.

As part of installation, you need to download required packages and modules for Ansible and Kubernetes.

Hardware

You can find the Genesys recommended hardware specifications in the following table. The sizing is arrived based on the number of active PureConnect users. Larger deployments may require more CPU and RAM to retain performance for the increased incoming traffic from the PureConnect Server.

==== YOURS //hyd-arunas-

Leic_main_systest/products/documentation/source/Technical_Reference_HTML/cx_insights_icg/CX_Insights_requirements.htm border-bottom: Solid 1px #000000; ">

Small-size customers

<<<<

Component	Large-size customers	Mid-size customers	Small-size customers
Number of agents in Contact Center	Above 400	50-400	Less than 50
Platform	Virtual machine or physical server	Virtual machine or physical server	Virtual machine or physical server
CPU	 8 cores AMD-V or VT-X VM- extensions 	 8 cores AMD-V or VT-X VM- extensions 	 4 cores AMD-V or VT-X VM- extensions
RAM	32 GB	20 GB	16 GB
Primary partition	100+ GB (recommended) 50 GB (minimum)	50 GB (recommended) 35 GB (minimum)	40 GB (recommended) 30 GB (minimum)
Secondary partition	400+ GB 100 GB (minimum)	60 GB (recommended) 45 GB (minimum)	45 GB (recommended) 35 GB (minimum)

Software

Important!

During installation of CentOS, you must include Virtualization Host to minimize the amount of extra configuration required to get Kubernetes running.

If Docker is already installed, ensure that you uninstall it.

Component	Requirement
Operating system	CentOS 7, RHEL version 7.6, 7.7 and 7.8 The host supports RHEL versions mentioned above. However, the base image in the container still contains CentOS and Alpine Linux.
Software components	Virtualization Host: • KVM • QEMU • QEMU+KVM • Libvirt

Related Topics:

Install CX Insights server

CX Insights licensing

CX Insights requires an Analytics access license for users, and an Analytics feature license.

Analytics access licenses

To verify if you have the Access licenses, go to the **License Management** form in Interaction Administrator and under the **Licenses** tab, verify the availability of following licenses.

License	Description
I3_ACCESS_ANALYTICS_CORE	Basic dashboard license to view dashboards.
I3_ACCESS_ANALYTICS_DESIGNER	This license allows a user to create and modify dashboards.

Title	Assignable Allowed	Assignable Configured	Concurrent Allowed	Concurrent Configured	Concurrent In Use	1
13_ACCESS_ACD_MEDIA_1	20000	0	20000	0	0	
13_ACCESS_ACD_MEDIA_2	20000	0	20000	0	0	
I3_ACCESS_ACD_MEDIA_3_PLUS	20000	49	20000	0	0	
3_ACCESS_ACD_SOCIAL_MEDIA	20000	49	20000	0	0	
3 ACCESS ACD WHATSAPP	20000	49	20000	0	0	
3_ACCESS_ANALYTICS_CORE	20000	6	20000	0	0	
3_ACCESS_ANALYTICS_DESIGNER	20000	1	20000	0	0	
3_ACCESS_ANALYZER	20000	49	20000	0	0	
3_ACCESS_APPLICATION_PORT_ADDON	100	0	100	0	0	
3_ACCESS_CLIENT	20000	49	20000	0	0	~

The License Management dialog displays the number of available licenses.

Analytics feature license

To verify if you have the Analytics feature license, go to the License Management form in Interaction Administrator and under the Features tab, verify the availability of the I3_FEATURE_ANALYTICS license.

	License Management	? ×
Licenses Features		
Name I3_FEATURE_2_3_1_FP1 I3_FEATURE_2_4_FP0.IENT I3_FEATURE_AD_HOC I3_FEATURE_ADVANCED_CAMPAIGN_MANAGEMENT I3_FEATURE_ADVANCED_SECURITY I3_FEATURE_ALTERNATE_FIRMWARE_DISTRIBUTION		
I3_FEATURE_ANALYZER I3_FEATURE_ANALYZER I3_FEATURE_ANALYZER_LANGUAGE_CA I3_FEATURE_ANALYZER_LANGUAGE_DE		×
Trial Dates: 2018-02-23 - 2018-08-23 Load License View Host ID		Close

If a license is not present or you do not have enough licenses, contact your sales representative. Also, see <u>Allocate Analytics</u> <u>licenses</u>.

CX Insights server installation

The CX Insights server hosts the MicroStrategy BI platform, which is the back-end for providing real-time analytics and dashboards in the CX Insights web application. The following server setup and configuration instructions require a knowledgeable Linux administrator and familiarity with CentOS, Red Hat Enterprise Linux (RHEL), Kubernetes, and Ansible.

Prerequisite

- CIC version must be 2020 R4.
- For CX Insights version 3.0 and above, the minimum required CIC version must be 2020 R3.
- If you are configuring the backup directory, then you must have the following:
 - A share path (for example, NFS share) of the remote computer where you are configuring the backup.
 - User installing the CX Insights server must have write access to the share path on the remote computer.

Install CX Insights server

- 1. Install CentOS 7 or RHEL version 7.6, 7.7 or 7.8 on either a physical or virtual server that meets the minimum requirements for the production environment. For more information about minimum requirements, see <u>CX Insights server requirements</u>.
- 2. Download CX Insights Docker containers from the following website:

https://help.genesys.com/utilities-and-downloads.html

- 3. Extract the CX Insights artifacts archive that contains ansible_install, cxinsights-playbook.tgz, pcon-mstr.zip, and cx-insights.tgz.
- 4. Run the shell script **ansible_install.sh** to install the dependencies like Python, Ansible packages using the root user account. It also creates the CX Insights user account to perform all the Ansible roles and tasks.

Notes:

- If the CentOS already has pip installed, then ensure that pip is of version 8.1.2, which is compatible with Python 2.7.5 else all the installation will fail.
- By using the command **which ansible**, verify if Ansible is installed. If it is installed, you can see the Ansible version 2.9.10 and can also verify by running **ansible -version** command. Otherwise, rerun the ansible_install shell script.
- By using the command cut -d: -f1 /etc/paswd and logging into CX Insights account, verify if CX Insights account is created.
 - su cxinsights
- 5. Prerequisite for running Ansible-playbook
 - Extract the cxinsights-playbook-k3s.zip file to the CX Insights user home directory. After extraction, move the kube_archive_clean.py file to the /home/cxinsights directory.
 - Generate Ansible vault for CX Insights user password. Ansible modules require this value to install k3s, helm, and tiller.
 - Ansible-vault encrypt_string 'passwd' --name 'helm_linux_host_passwd' --vault-id cxinsights@prompt, replace passwd with CX Insights user account password. It asks for the password for vault usage, enter the password and make a note of it, so that the user can enter the same password while running ansible-playbook command
 - Ansible-vault encrypt_string 'passwd' --name 'tiller_linux_host_passwd' --vault-id cxinsights@prompt, generate the password again only if you are planning to keep controller and CX Insights server separately, else add the above generated vault value in both helm_linux_host_passwd and till_linux_host_passwd in the group_vars/all.yml file as shown below

- Configure a backup directory and a cron job expression using the following parameters in the group_vars/all.yml file to backup CX Insights data.
 - backup_dir specify the backup directory path. Configuring backup_dir is mandatory. For backup purposes, create the backup directory as a share path on a remote computer and mount the same on the local computer where you installed the CX Insights server. Example, /mnt/nfs/share/gcxibackup
 - cron_schedule specify the cron expression that defines the backup frequency in which the backup activity runs. Configuring cron_schedule is optional. If you do not define any expression, the backup activity runs at the default time every day, that is at 12.00 am. An example cron expression to run the backup activity every day at 7.00 am and 12.00 pm looks like: "0 7,12 * **". Note that Cron job is added for the root user only.

You can also restore the backed-up data at a future date when there is a system failure. For more information about restore, see <u>Backup and restore configuration</u> topic.

• Specify the Genesys CX Insights (gcxi) properties in the values.yml file by referring to the following table:

Property name	Description
cicServerName	The IP address of the primary CIC server.
cicBackUpServerName	The IP address of the secondary CIC server.
cicDBName	The (SQL Server) CIC database name, specified in Setup Assistant.
cicDBHost	The (SQL Server) CIC database server name, specified in Setup Assistant.
cicDBLoginID	Specify the CIC database user ID of a user to read historical data from the database. The user ID you specify here is same as the IC Report Logs user ID specified in Interaction Administrator.
cicDBLoginPwd	Specify the encoded password of CIC database user ID mentioned in cicDBLoginID. Encrypt password using <i>base64</i> encryption method only.
	Tip: You can use the following command to encrypt your password:
	echo "testpassword" base64
langs (optional)	The localization language required for your organization. Configuring langs is optional.
	The US English (en_US) is mandatory. You can also specify other supported languages of your choice along with en_US. Currently, the supported language pack values are: en-US,fr-FR,de-DE,ja-JP,pt-BR,es-ES,zh-CN,nl-NL,pl-PL
	For more information about the language pack configuration, see the sample configuration given below this table.

certICSAML	Specify the certificate details required for SAML authentication. Copy the contents of the certificate details from the ICSecureTokenServerCertificate.cer file in the CIC Server IC-Token Service folder (I3\IC\Certificates\ICSecureTokenServer\Default\ICSecureTokenServerCertificate.cer) and paste it here.
proxyEndpoint	Specify the Fully Qualified Domain Name (FQDN) of a proxy server if the CX Insights server is accessed through a proxy server. If a proxy server is not configured in your environment, then you must specify the FQDN of the CX Insights server.
secret	Secret used for web socket authentication between the Analytics bridge and the microservices (mstrdataadapterserver and mstrtconnector). Ensure that the secret given here and the secret given in Interaction Administrator > System Configuration > Analytics > Configuration are same.
Global variables	
tz	Specify the time zone of the region where gcxi server is installed.
hosts	The Linux host name of the CX Insights server. Note that the host name you specify here must be an FQDN.
maxPoolSize (optional)	The maximum number of concurrent web sessions allowed. This is an optional parameter and the default value is 200 .
tls (ingress) •	If you do not want to enable TLS secured communication for ingress, keep the square brackets as given in the values.yml file, that is, []. If you want to enable TLS secured communication for ingress, remove the square brackets and specify the host name (ingress endpoint) and its secret. Note : If you enable TLS, you must install an SSL certificate by following the <u>Install SSL certificate on</u> <u>CIC server</u> procedure.
secret name (ingress)	Specify the Kubernetes cluster secret. We recommend that you keep the secret name value as given in the values.yml file, that is, pcn-cxinsights-tls
hosts (ingress)	Specify the FQDN of ingress host. Typically, this is the FQDN of the CX Insights server that you configure in the hosts setting.
tls (prometheusIngress)	If you do not want to enable TLS secured communication for Prometheus ingress, keep the square brackets as given in the values.yml file, that is, []. If you want to enable TLS secured communication for Prometheus ingress, remove the square brackets and specify the host name (Prometheus ingress endpoint) and its secret.
	Note: If you enable TLS, you must install an SSL certificate by following the <u>Install SSL certificate on</u> <u>CIC server</u> procedure.
secret name (prometheusIngress)	Specify the Kubernetes cluster secret. We recommend that you keep the secret name value as given in the values.yml file, that is, pcn-cxinsights-tls
hosts (prometheusIngress)	Specify the FQDN of Prometheus ingress host. Typically, this is the FQDN of the CX Insights server that you configure in the hosts setting.

Sample values.yml file configuration:

```
gcxi:
      gcxiproperties:
            cicDBName: I3 IC MERCURY
            cicDBHost: qf-analyticstest.com
            cicServerName: 182.26.13.72
            cicBackUpServerName: 182.26.13.72
            cicDBLoginID: "IC_ReadOnly"
            cicDBLoginPwd: "aTM="
            langs: en-US, fr-FR, de-DE, ja-JP, pt-BR, es-ES, zh-CN, nl-NL, pl-PL
            maxPoolSize: 250
            certICSAML:
            MIIDoTCCAomgAwIBAgIFQWCBgwkwDQYJKoZIhvcNAQEFBQAwRzEQMA4GA1UECgwH
            U2VydmVyczEVMBMGA1UECwwMU2VydmVyIEdyb3VwMRwwGgYDVQQDDBNPbHltcGlh
            LmRldjIwMDAuY29tMB4XDTIwMDMwNzIxNDQ0M1oXDTQwMDMwODIxNDQ0M1owRzEQ
            {\tt MA4GA1UECgwHU2VydmVyczEVMBMGA1UECwwMU2VydmVyIEdyb3VwMRwwGgYDVQQD} \\
            DBNPbHltcGlhLmRldjIwMDAuY29tMIIBIjANBqkqhkiG9w0BAQEFAAOCAQ8AMIIB
            CqKCAQEAs9WJ+2CqWRvQZs2SHc3kf/Ia+fOxW44SDqHxEMHKIqHx0rXwmuGbqTTt
```

```
proxyEndpoint:
     - pcn-rhel7-rh8.testCXI.com
secret: analytics
qlobal:
      tz: America/Indiana/Indianapolis
      hosts:
            - pcn-rhel7-rh8.testCXI.com
      ingress:
            tls:
                  - secretName: pcn-cxinsights-tls
      hosts:
            - pcn-rhel7-rh8.testCXI.com
      prometheusIngress:
            tls:
                  - secretName: pcn-cxinsights-tls
      hosts:
            - pcn-rhel7-rh8.testCXI.com
```

• Below is the **inventory.yml** file in the cxinsights-playbook-k3s directory, specify with appropriate values. For example: Assume Ansible and k3s are running on the same machine. If the controller is different from target machine, then helm_linux_host should be the controller host FQDN and tiller-linux-host should be the FQDN of the CX Insights server host.

```
helm_linux_host:
hosts:
xxx-xxxxx-xxxxx.com
vars:
ansible_user: '{{ user }}'
ansible_ssh_pass: '{{ passwd }}'
tiller_linux_host:
hosts:
xxx-xxxxx-xxxxx.com
vars:
ansible_user: '{{ user }}'
ansible_ssh_pass: '{{ passwd }}'
```

• If this is the fresh installation and you want to save the application data in secondary partition, keep the default value of data_dir as given in the main.yml file. The default value of data_dir is /home/cxinsights/kube_data. If you are already using the primary partition, modify the data_dir value in the main.yml file as shown below.

data dir: ''

Note: If this is the fresh installation of CX Insights, we recommend that you deploy the software in secondary partition, provided you have the disk space as recommended in <u>step 1</u>. Drive partitioning and using secondary drive to save CX Insights data is possible only for fresh installation. If CX Insights is already installed without partitioning the drive, you may not be able to use the secondary drive. In that case you must modify **data_dir** as '.

6. Run the Ansible Playbook to start the services on the CX Insights server. For the first time, it is slow as dependencies get installed.

```
sudo ansible-playbook --vault-id cxinsights@prompt -i inventory.yml site.yml -K
```

Note:

- Make sure you enter CX Insights password when BECOME password is asked.
- After the deployment is triggered, you must wait for some time until the state of GCXI pod is healthy.
- Run the below mentioned commands to ensure that everything is up and running.
 - To see all the containers are up and running in all namespaces, use the command kubect1 get pods -A
 - To see all the containers are up and running only in pcn-cxinsights-system namespace, use the command kubectl get pods --namespace=pcn-cxinsights-system

[cxinsights@qf-cx-docker cxinsights-playbook-k3s]\$ kubectl get p	odsnar	nespace=pcr	n-cxinsight:	s-system

Install SSL certificate on CIC server Ports exposed on CX Configure CX Insights in Interaction Administrator Backup and restore configuration Troubleshooting Upgrade containers

Install SSL certificate on CIC server

The communication between the CIC server and Kubernetes is secured over the TLS protocol. This requires an installation of a valid SSL certificate signed by a third party or a self-signed SSL certificate which is auto generated in the file name tls.crt in the /root directory of the CX Insights server.

Note:

- If you enable TLS in values.yml file for ingress or Prometheus ingress, you must install a valid SSL certificate.
- Ensure that you install the SSL certificate in both the primary and secondary CIC servers.

To install the SSL certificate,

1. Copy the SSL certificate from the CX Insights server to a wanted location on the CIC server.

- 2. Right-click on the SSL certificate (tls.crt) from the CIC server and click Install Certificate.
- 3. On the Certificate Import Wizard, in the Store Location section, select Local Machine, and click Next.
- 4. Select Place all certificates in the following store option.
- 5. Click Browse. On the Select Certificate Store pop-up, select Trusted Root Certification Authorities as the certificate store and click Ok.

6. On the Certificate Import Wizard, verify the Certificate store selection and click Next.

← 🐓 Certificate Import Wizard

Certificate Store

Certificate stores are system areas where certificates are kept.

Windows can automatically select a certificate store, or you can specify a location for the certificate.

O Automatically select the certificate store based on the type of certificate

Place all certificates in the following store

Certificate store:

Trusted Root Certification Authorities

Browse...

The second s	Next Cancel	Next
--	-------------	------

- 7. Click Finish. A dialog showing the message "The import was successful." appears if the certification installation is correct.
- 8. Click Ok.

Related Topics: Install CX Insights server Ports exposed on CX Insights server Configure CX Insights in Interaction Administrator

Upgrade containers

You can upgrade the CX Insights' containers whenever there is a new Analytics release with new features and critical updates.

To upgrade containers,

1. In the values.yml file, update proper tag name for containers that need upgrade, see example below. If you want to upgrade only one container, then add tag for the corresponding container and you can omit rest of the properties.

```
gcxi:
  image:
   tag: 2.0
    tagcontrol: 2.0
gcxi-postgres:
  image:
   tag: 2.0
mstrconnector:
 image
  tag: 2.0
mstrdataadapteragent:
 image:
   tag: 2.0
mstrdataadapterserver:
  image:
    tag: 2.0
```

2. Run the following command in the path /home/cxinsights/cxinsights-playbook-k3s/

sudo ansible-playbook --vault-id cxinsights@prompt -i inventory.yml site upgrade.yml -K

Roll back containers

To roll back containers, get the list of versions installed by running the following command.

helm history pcc-helmcharts --tiller-namespace pcn-tiller-system

Sample output shown in the following screenshot

[cxinsights@qf-cx-docker	pcc-cxinsights-playbook	<pre>{]\$ helm history</pre>	pcc-helmcharts	tiller-namespace pcn-tiller-system
REVISION UPDATED		STATUS	CHART	DESCRIPTION
1 Fri Mar	6 06:57:32 2020	SUPERSEDED	pcon-mstr-0.1.0	Install complete
2 Fri Mar	6 07:18:08 2020	SUPERSEDED	pcon-mstr-0.1.0	Upgrade complete
3 Fri Mar	6 07:32:30 2020	DEPLOYED	pcon-mstr-0.1.0	Rollback to 1

Replace the version number that needs to be rolled back in **roles/helm-chart-rollback/vars/main.yml** file and run the following command:

sudo ansible-playbook --vault-id cxinsights@prompt -i inventory.yml site rollback.yml -K

Deleting deployment

Use the following command to delete the entire deployment such as pods, services, ingress endpoints, and persistent volumes.

sudo ansible-playbook --vault-id cxinsights@prompt -i inventory.yml site_delete.yml -K

Running the above command is equivalent to helm delete command.

Install CX Insights server

CX Insights monitoring and alerting

Install Prometheus

Prometheus is an open source software licensed under the Apache 2.0 license. When you install Prometheus, make sure that you install Prometheus in a private network.

- 1. Download Prometheus from https://prometheus.io/download/ and extract the files from the folder.
- 2. Copy alerts.yml inside Prometheus folder and update prometheus.yml rule_files property with alerts.yml.
- Change Prometheus.yml with the below mentioned content and replace <SERVER> with Linux host (Where all the containers
 are up and running). In rules_files section alerts.yml file reference is provided which contains all the alert scenarios.
 Scrape_interval is the interval in which data is pulled from all services and evaluation_interval is the internal all rules are
 evaluated.

```
# my global config
global:
scrape interval: 15s # Set the scrape interval to every 15 seconds. Default is every 1
minute.
evaluation interval: 15s # Evaluate rules every 15 seconds. The default is every 1 minute.
# scrape timeout is set to the global default (10s).
# Alertmanager configuration
alerting:
alertmanagers:
- static configs:
- targets:
# - alertmanager:9093
# Load rules once and periodically evaluate them according to the global
'evaluation interval'.
rule files:
- alerts.yml
# - "first rules.yml"
# - "second rules.yml"
# A scrape configuration containing exactly one endpoint to scrape:
# Here it's Prometheus itself.
scrape configs:
# The job name is added as a label `job=<job name>` to any timeseries scraped from this
config.
- job name: 'DataAdapterServer'
metrics path: /DataAdapterServerMetrics
static configs:
- targets: ['<SERVER>']
- job name: 'Connector'
metrics path: /ConnectorMetrics
static configs:
- targets: ['<SERVER>']
- job name: 'Postgress'
metrics path: /PostgresMetrics
static configs:
- targets: ['<SERVER>']
- job name: 'DataAdapterAgent'
metrics path: /DataAdapterAgentMetrics
static configs:
- targets: ['<SERVER>']
- job_name: 'GCXI'
static configs:
- targets: ['<SERVER>']
relabel configs:
- source labels:
  metrics path
action: replace
target label: metrics path
replacement: /mstr-integrationapi/GcxiMetrics
```

- After running Prometheus executable, ensure <u>http://localhost:9090/rules</u> is accessible and all rules are defined properly. Warning and critical alerts are configured, warning is of less priority, if there are any critical alerts raised, then file a ticket with proper logs.
- 5. The http://localhost:9090/targets shows container state.

- 6. Alerts information can be seen in http://localhost:9090/alerts
- 7. To receive an e-mail notifications/pagerduty configure alertmanager. More details about alert manger is found in https://prometheus.io/docs/alertmanager/ and download is available in the https://prometheus.io/download/.
- 8. After downloading configure prometheus.yml with alert manager in the # Alertmanager configuration

```
alerting:
alertmanagers:
- static_configs:
- targets:
- alertmanager:9093
```

9. To receive email notifications from alert manager, configure alertmanager.yml as shown below with details.

```
route:
group by: ['alertname']
group_wait: 30s
group interval: 10s
receiver: 'email-me'
routes:
- match:
severity: warning
repeat interval: 1h
- match:
severity: critical
repeat_interval: 15m
receivers:
- name: 'email-me'
email_configs:
- to: xxxxxxx@xxxx.com
from: xxxxxxx@xxxx.com
smarthost: xxxxx
auth username: ""
auth password: ""
```

Configure reverse proxy using nginx

You can install a public facing reverse proxy server and route all the incoming requests to the CX Insights server through proxy. Genesys verified the nginx reverse proxy server for the CX Insights server.

To install the nginx reverse proxy server, see nginx documentation.

To configure a reverse proxy server,

- 1. Find the **nginx.conf** in the installed path and copy the code given <u>here</u> to the **nginx.conf** file.
- 2. Within the copied code, update the appropriate values for the following parameters:
- <dns_server_name> specify the dns server name of the server where nginx is installed.
- <proxy_server_name> specify the host name where nginx is installed.
- <cxinsight_server_name> specify the server name where the CX Insights server is installed.

• If you don't have a TLS certificate from a Certification Authority, generate a self-signed certificate by using the following command. Copy the generated certificate (tls.crt) and key file (tls.key) file under the nginx directory.

```
openssl req -x509 -newkey rsa:4096 -sha256 -nodes -keyout /etc/nginx/tls.key -out
/etc/nginx/tls.crt -subj '/CN=<proxy_server_name>' -days 365
```

Note: Make sure that you configure TLS certificate and private key correctly, otherwise you cannot log in to CX Insights server.

4. Test the updated configuration in the **nginx.conf** file by running the following command. We recommend to test the configuration for any syntax errors whenever you make changes in the configuration file.

nginx -t

5. Restart the nginx service. Note that any changes in the nginx.conf file requires a restart of the nginx service.

Log file

You can view the error log file from the default path /var/log/nginx/error.log. If you want to set up a different path, you can do so in the error_log parameter in nginx.conf.

Code to be copied to the nginx.conf file

```
user nginx;
worker processes auto;
error log /var/log/nginx/error.log;
pid /run/nginx.pid;
# Load dynamic modules. See /usr/share/doc/nginx/README.dynamic.
include /usr/share/nginx/modules/*.conf;
events {
worker connections 1024;
}
http {
resolver <dns server name> valid=90000000s;
log_format main '$remote_addr - $remote user [$time local] "$request" '
'$status $body bytes sent "$http referer" '
'"$http_user_agent" "$http_x_forwarded_for"';
access log /var/log/nginx/access.log main;
sendfile on;
tcp nopush on;
tcp nodelay on;
keepalive timeout 65;
types hash max size 2048;
include /etc/nginx/mime.types;
```

```
default type application/octet-stream;
# Load modular configuration files from the /etc/nginx/conf.d directory.
# See http://nginx.org/en/docs/ngx core module.html#include
# for more information.
include /etc/nginx/conf.d/*.conf;
server {
listen 80;
listen [::]:80;
server_name _;
root /usr/share/nginx/html;
# Load configuration files for the default server block.

CX Insights server configuration

CX Insights server configuration

To configure the CX Insights server settings in Interaction Administrator, complete the following steps.

Allocate Analytics licenses

You can allocate a CX Insights Analytics License for each user in Interaction Administrator on the Licensing tab.

MWI Clie	ent Configurat	tion	Phonetic	Spellings	Options	Security	Cu	stom Attributes		History
Configuration	Licensing	Perso	nal Info	Workgroups	Roles	Genesys Clo	bud	Password Polic	ies	ACD
ACD Acce Media Media Media ACD Socia	nt ess License ss License 1 2 3 Plus on Types I Media tsApp		বোরারারারারার	ditional Licens Interaction A Interaction C Interaction C	Analyzer A Client Mobil Client Oper Client Outlo Data Extra Dialer Add- ceedback A Optimizer A Optimizer R Optimizer S	e Edition ator Add-On ook Add-In ctor On Access Access Real-tin lient Access eal-time Adhe chedulable			^	
O Group	Routed Work Routed Work s Monitor s Designer License er		বেরেরেরে	Interaction C Interaction R Interaction R Interaction S Interaction S Interaction S Interaction S Interaction S	Quality Mor Recorder A Recorder C Recorder E Gripter Supervisor	itoring Agent ccess lient Access xtreme Query iPad Edition	rical	pact the license	~	
Enable Lic	enses			usage co	unt.					

To assign an Analytics license to a user, select the Analytics License check box, and select one of the following licenses.

CORE	Basic dashboard license to view dashboards.
DESIGNER	This license allows a user to create and modify dashboards.

In addition, you must select the Enable Licenses check box to activate the Analytics license.

Related Topics: Install CX Insights server Configure CX Insights in Interaction Administrator Troubleshooting

Configure CX Insights server in Interaction Administrator

Once the CX Insights server is up and running, the next step is to configure the PureConnect server to connect to it. 1. Apply the I3 FEATURE ANALYTICS license to the PureConnect server.

To apply the I3_FEATURE_ANALYTICS license, open Interaction Administrator and go to File > License Management >Features tab, select the license, and click Load License.

2. Open Interaction Administrator and open the Analytics Node under System Configuration.

3. In the Analytics workspace, click Configuration. The Analytics Configuration dialog appears.

Analytics Configuration		?	×
Server Retention Settings			
Config URI:	wss:// <cx-insights-fqdn>/connector</cx-insights-fqdn>		
			_
Data URI:	wss:// <cx-insights-fqdn>/dataadapterse</cx-insights-fqdn>	rver	
Web Proxy URI:			
			_
Secret:	•••••		
	OK Cancel	Ap	oply

On the Server tab, configure the following values:

- Config URI is the web socket address that PureConnect uses to synchronize configuration and security settings with the CX Insights server (default port shown). Configure the value as shown in the above screenshot and replace <CX-Insights-FQDN> value with the CX Insights' server name. Note: If you are using secured communication (enabled TLS), configure the URI value as 'wss' else use 'ws'.
- Data URI is the web socket address through which PureConnect streams real-time statistics to the CX Insights server. Configure the value as shown in the above screenshot and replace <CX-Insights-FQDN> value with the CX Insights' server name. Note: If you are using secured communication (enabled TLS), configure the URI value as 'wss' else use 'ws'.
- Web Proxy URI is the target URL used by HttpPluginHost to route web requests.
- Secret is the secret that was entered in the secret field in the values.yml file when deploying the CX Insights Server.

Once Configuration is complete, the AnalyticsBridge subsystem will attempt to make the configured web socket connections. If the connections are established successfully, the synchronization process begins. Synchronization can take a few minutes to complete if there are large number of users and workgroups to transfer. Any additional changes to Users, Roles, Workgroups, Access Controls, or Memberships trigger extra synchronization cycles. Once the servers are synchronized, the AnalyticsBridge Subsystem begins streaming real-time statistics over the data web socket. At that point, users can view the real-time dashboards.

Retention Settings

Using retention settings, you can define how many days you want to retain the IVR data history. Based on the settings, the historical IVR data will be purged at the specified interval. For more information, see <u>Retention settings</u> in Interaction Administrator help.

Configure Administrator Access for CX Insights

You can restrict which user, workgroup, or role has access to configure the Analytics feature.

To assign administrator access for Analytics:

- 1. In Interaction Administrator, go to the User, Workgroup, or Role properties dialog box.
- 2. Select the **Security** tab.

	User Configuration - user1 ? ×									
	Configuration Licensing Personal Info Workgroups Roles Password Policies ACD MWI Client Configuration Phonetic Spellings Options Security Custom Attributes History									
	Access Rights									
Change the settings for Access Rights. Change the settings for Access Rights. Master Administrator Allow Administrative Access editing Allow Access Control editing Access Control										
	Security Rights Change the settings for Security Rights. Security Rights									

- 3. Click Administrator Access.
- 4. In the Administrator Access dialog, type analytics in the Search field to filter the list.

		Administrator Access		
Category: <all></all>	✓ Search:		Clear

- 5. To give a user, workgroup, or role Administrator Rights to the Analytics feature, select the **Analytics** check box. You can clear the check box to remove the privilege.
- 6. Click Close.
- 7. To save the settings, click **OK** or **Apply**.

Configure Access Control for CX Insights dashboards

You can restrict which user, workgroup, or role has access to specific dashboards.

To assign dashboard access:

- 1. In Interaction Administrator, go to the User, Workgroup, or Role properties dialog.
- 2. Select the **Security** tab.

		User (Configuratio	n - user	1	1	?)				
Configuration	nfiguration Licensing Personal Info Workgroups Roles Password Policies ACD

analyticsadminstation qf-analytics Stations																
analyticsadminstation qf-analytics																
User Queues analyticsadmin Users																
analyticsadmin																

Note:

If the IC Server is in sync with the MicroStrategy server, then you can see the check boxes for all the dashboards.

- 5. To assign a user, workgroup, or role access to the dashboard, select the dashboard check box, or select All to assign access to all dashboards. Clear a check box to remove the privilege.
- 6. Click Close.
- 7. Click OK or Apply to save settings.

Test the CX Insights installation

After you complete the initial configuration and user access, test the CX Insights installation by opening a CX Insights dashboard.

To access a dashboard,

- 1. Log in to CX Insights. You can use the same login credentials that you use for PureConnect.
- 2. Click the CX Insights folder.
- 3. Select IVR Dashboards or Real Time Dashboards. Both these dashboards offer a range of metrics presented in different views.
- 4. Select the dashboard you want to explore. For example, the following image shows the Agent Details dashboard.

Note!

You can only view the dashboards for which you have access permissions defined in the CIC server. After successful loading, the Real Time dashboards refresh every 30 seconds with real-time statistic values.

The dashboards you can view depends on the Analytics license type (Designer/Core) you are assigned and the access permissions to view.

Backup and restore configuration of CX Insights data

CX Insights allows you to backup data at regular intervals. In case, there is a system failure, you can also <u>restore</u> the backed-updata to a new computer.

The procedures in this topic help you to configure data backup and restore settings for CX Insights.

Backup CX Insights data

You can configure the backup settings either in an all.yml file or run a script manually.

Configure CX Insights backup through Ansible

In this method, you can configure the backup criteria through Ansible installation. To start with, configure backup values even before running the Ansible installation. For more information about Ansible installation, see <u>CX Insights server installation</u> procedure.

Prerequisite

- A share path (for example, NFS share) on the computer where you are configuring the backup.
- User installing the CX Insights server must have write access to the share path.

To configure the backup settings

1. Mount the shared backup directory (example, NFS share) on the local computer where you installed the CX Insights server. For example, /mnt/nfs/share. The mounted directory is the backup path that maintains the CX Insights backup data. You can verify the mounted path using the "mount|grep" command as shown in the following example.

mount|grep "/mnt/nfs/share"

- 2. Configure the following values in the group_vars/all.yml file.
- **backup_dir** specify the backup directory path. For example, /mnt/nfs/share/gcxibackup. Configuring backup_dir is mandatory.
- cron_schedule specify the cron expression that defines the backup frequency in which the backup activity runs every day. Configuring cron_schedule is optional. However, if you do not define any expression, the backup activity runs at the default time every day, that is 12.00 am. An example cron expression to run the backup activity every day at 7.00 am and 12.00 pm looks like: "0 7,12 * **"

Note: Cron job is added for the root user only.

3. Convert the cxinsight-backup-restore.sh file to Unix format. You can do the conversion either by running the dos2Unix tool or by running the sed command as shown below.

sed -i 's/\r//g' cxinsight-backup-restore.sh

4. Log in as CX Insights user and run the <u>Ansible installation</u> using the following command.

sudo ansible-playbook --vault-id cxinsights@prompt -i inventory.yml site.yml -K

Note:

- Running the above Ansible installation command installs the pods, and configures the backup settings which generate the **.gcxi_backup_cron.sh** file at /home/cxinsights/.gcxi_backup_cron.sh. However, it does not perform the actual backup. The actual backup is performed when the first scheduled backup activity runs or when the user backs up manually.
- If backup configuration causes any errors in Ansible installation, correct the errors, and configure the backup settings <u>manually</u>.
- You can verify the backup activity logs from the path /home/cxinsights/.gcxi_backup_trace.log

Configure CX Insights backup through script

For some reasons, if Ansible installation fails to configure the backup settings, you can configure it manually by running a script.

To configure the backup settings

1. Mount the shared backup directory (example, NFS share) on the local computer where you installed the CX Insights server. For example, /mnt/nfs/share. The mounted directory is the backup path that maintains the CX Insights backup data. You can verify the mounted path using the "mount|grep" command as shown in the following example.

```
mount |grep "/mnt/nfs/share"
```

2. Run the script **cxinsight-backup-restore.sh** manually by providing the backup path and cron expression as shown below in the path /home/cxinsights/cxinsights-playbook-k3s

Syntax:

```
sudo cxinsight-backup-restore.sh backup <backup dir> ["Cron expression"(optional)]
```

Example:

```
sudo cxinsight-backup-restore.sh backup /mnt/nfs/share/gcxibackup "* */6 * * *"
```

Important:

- Run the **cxinsight-backup-restore.sh** script only once. Rerunning the script overwrites log file and backs up old data in the configured backup path.
- If you accidentally delete the volumes folder (for example, through helm delete), you must rerun the **cxinsight-backup**restore.sh script to set up the backup path and the cron job schedule.

Instant backup

Run the following script if you want to backup CX Insights data instantly instead of waiting for the scheduled backup activity.

sudo /home/cxinsights/.gcxi_backup_cron.sh

Restore CX Insights data

You might want to restore old CX Insights data in case you replaced or upgraded your hardware. You can restore older data if you have a proper backup and you know the correct backup path.

You can provide the restore settings either in an all.yml file or run a script manually.

Prerequisite

A share path (for example, NFS share) of the computer where you are restoring the backup.

Configure CX Insights data restore through Ansible

To configure the restore settings,

- 1. Follow the steps 1-3 in configuring CX Insight backup through Ansible procedure.
- 2. Verify that the mounted directory has the following volume folders.

\$ ls /mnt/nfs/share/gcxibackup

cube gcxi-data gcxi-volume

- 3. In the group_vars/all.yml file, configure is_restore as true.
- 4. Log in as CX Insights user and run the Ansible installation using the following command.

sudo ansible-playbook --vault-id cxinsights@prompt -i inventory.yml site.yml -K

Note:

- Running the above command restores the CX Insights data and creates a new backup directory. You can find the restored data in an archive file created within the backup directory. The archive file is created with the date and time (example, gcxi-backup_2020-08-06_01-55-36.tar.gz) so that you can identify which file is relevant for you.
- The Ansible installation requires several parameters to be configured as part of CX Insights server installation. For more information, see <u>Install CX Insights server</u>.
- 5. Once restoration is successful and complete, change **is_restore** to its default value (**false**) in the **group_vars/all.yml** file. Changing **is_restore** back to its default value avoids unnecessary data restore during future upgrades.

Configure CX Insights data restore through script

If automatic restoration fails for any reason, you can restore the CX Insights data manually by using the following procedure. 1. Follow the steps 1-3 in configuring <u>CX Insight backup through Ansible</u> procedure. 2. Verify that the mounted directory has the following volume folders.

\$ ls /mnt/nfs/share/gcxibackup

cube gcxi-data gcxi-volume

3. Run the restore script **cxinsight-backup-restore.sh** by providing restore directory as shown in the following example.

sudo cxinsight-backup-restore.sh restore /mnt/nfs/share/gcxibackup

Running the restore script automatically creates the new backup path and restores the old data.

Note:

- The time taken to restore the old data depends on its size. In test environment, the average duration to restore the old data is about 15 minutes approximately.
- You can restore the old data that is backed up until the last backup activity. The dashboard or metrics created after the backup activity is complete and before the system failure cannot be restored. For example, if the backup activity runs at 10.00 pm every day, and if the system stopped responding at 11.00 pm, then the data created between 10.00 pm and 11.00 pm is not restored.
- Do not use * in directory names.

Backup log files

You can find the archive of CX Insights log files such as application log, tomcat log, and so on, in the backup directory configured as part of backup settings. The log files are archived in the tar format with the archived date and time as its file name.

To backup log files, you do not need any specific configuration.

Related Topics: Install CX Insights server

DataSource Configuration

Starting from PureConnect 2021 R3 release, connection from MicroStrategy to CIC and Dialer Databases running on the SQL is supported. It gives flexibility for the designer users to create dashboards by accessing all the tables in database. To support the connection, few data source configuration needs to be done in the Interaction Administrator.

The following steps can be performed before or after CX Insights Server setup.

1. Create data source IC_CXINSIGHTS for IC Database and IC_CXINSIGHTS_DIALER for Dialer. Follow the below mentioned naming conventions, names are case sensitive try to match it exactly same give below.

2. Enter the information in the Enter IC Data Source Name box.

Notes

- User ID created in the database should be Read Only user, as Admin users might loose the data when the CX Insights Designer User might play with table data while creating dashboards, to avoid deletion or edit of data, use read only account.
- For now ODBC DSN is not supported, so provided the data in the Additional Information as shown below:

Driver={SQL Server};Database=<database>;Server=<sql server hostname>;NETWORK=dbmssocn;Trusted_Connection=No;I3ATTR_IDLETIMEOUT=300

IC Data Source Con	figuration - IC_CXINSIGHTS	?	×							
ODBC Data Source C	Configuration Custom Attributes History									
Subtype:	Microsoft SQL Server V Read Only File DSN									
Connection Infor	mation									
ODBC DSN:	Qualifier:									
User ID:	IC_READONLY Password:									
Manually ente	r connection string									
Connection String	g:									
Additional Information: Driver={SQL Server};Database=I3_IC_DAMPE;Server=dl-sql01.ininlab.com;N										
Confirm auto-save OK Cancel Apply										

After successfully updating the data sources, verify the data sources access in MicroStrategy Web Application using Designer User account.

Custom Status in CX Insights

- 1. Open Interaction Administrator and Select Status Messages.
- 2. We have created a custom status with name On ACD Call. We have added this as User selectable.

Message Name 🛛 🖉	Message	Group	Sametime Equival	Sametime to	U	Persi	DND	Date	Time	ACD	Forw	ACW	Allo
AcdAgentNotAnsw	ACD - Agent Not	UNAVAILABLE	<none></none>	No	No	No	Yes	No	No	No	No	No	No
At a training session	At a Training Sessi	TRAINING	<none></none>	No	Yes	Yes	Yes	Yes	Yes	No	No	No	No
At Lunch	At Lunch	BREAK	<none></none>	No	Yes	Yes	Yes	No	Yes	No	No	No	No
Available	Available	AVAILABLE	<none></none>	No	Yes	Yes	No	No	No	Yes	No	No	Yes
Available, Follow-Me	Available, Follow	AVAILABLE	<none></none>	No	Yes	Yes	No	Yes	No	No	No	No	No
Available, Forward	Available, Forward	AVAILABLE	<none></none>	No	Yes	Yes	No	No	No	No	Yes	No	No
Available, No ACD	Available, No ACD	AVAILABLE	<none></none>	No	Yes	Yes	No	No	No	No	No	No	No
Away from desk	Away from desk	UNAVAILABLE	<none></none>	No	Yes	Yes	Yes	No	No	No	No	No	No
Do Not disturb	Do Not Disturb	UNAVAILABLE	<none></none>	No	Yes	Yes	Yes	No	No	No	No	No	No
Follow Up	Follow Up	FOLLOWUP	<none></none>	No	No	No	Yes	No	No	No	No	Yes	No
Gone Home	Gone Home	UNAVAILABLE	<none></none>	No	Yes	Yes	Yes	No	No	No	No	No	No
In a meeting	In a Meeting	UNAVAILABLE	<none></none>	No	Yes	Yes	Yes	Yes	Yes	No	No	No	No
On ACD Call	On ACD Call	UNAVAILABLE	In a Meeting	No	Yes	No	No	No	No	No	No	No	No
On Vacation	On Vacation	UNAVAILABLE	<none></none>	No	Yes	Yes	Yes	Yes	No	No	No	No	No
Out of the office	Out of the Office	UNAVAILABLE	<none></none>	No	Yes	Yes	Yes	Yes	Yes	No	No	No	No
Out of town	Out of Town	UNAVAILABLE	<none></none>	No	Yes	Yes	Yes	Yes	Yes	No	No	No	No
Working at Home	Working At Home	UNAVAILABLE	<none></none>	No	Yes	Yes	Yes	No	No	No	No	No	No

- 3. To make the custom status visible in CX Insights, we need to add an entry in DS registry.
- 4. Run **DSEditU** from CIC server run command.
- 5. It will open the DSEdit Window.

18. Open Multiple Agent Status Dashboard from CX Insights.

19. On ACD Call status shown in dashboard for User1.

Troubleshooting CX Insights for Installation and Configuration Issues

Troubleshooting CX Insights installation and configuration issues require an administrator status (root permissions) and privileges, and access to the servers hosting CX Insights.

Error	Description	Solution
User is unable to login to the CX Insights server.	This error may occur if the Endpoint update service is not running.	Verify if the Endpoint update service is up and running by using the following command: systemctl status endpoint If the status of the service shows that it is stopped, start the service by running the following command: systemctl start endpoint If the service doesn't start, verify if the endpoint service update file is available in the following location: /usr/local/bin/endpoint-update- service.py You can also verify the endpoint.log for more information which is located inside the gcxi-log persistent volume .An example path looks like/opt/local- path-provisioner/pvc-3f41dbeb-2649-40ad- 9106-54228244ce77
Current user has no accessible project, or lacks privilege 'WebUser'. Please contact the administrator.	This error may occur when a user without an Analytics license logs in to the CX Insights application.	For the specific user, in Interaction Administrator>User configuration dialog, enable Analytics License (Core) and also select Enable Licenses check box. If the same error occurs even after enabling the licenses, clear the cookies and try logging in again.
Bad gateway	This error may occur when a user logs in with a different account, and proceed logging in by selecting Trusted Authentication Request.	Verify if IC-Secure Token is reachable in CIC Server.
Error in login Please contact your Administrator.	This error may occur when a user logs in with a different account, and proceed logging in by selecting Trusted Authentication Request .	Verify if IC Secure Token Certificate is properly placed in vi /opt/tomcat/webapps/MicroStrategy/WEB- INF/classes/resources/SAML/IDPMetadata.xm in the CX Insights server. You can also check SAML.log for more information. Tip: To get the path of SAML.log file, run the following command: find / -name 'SAML.log'
\$'\r': command not found	While running the shell script, this error may occur because Windows uses '\r\n' as a new line character and Linux uses '\n'	To resolve this error, remove '\r' by using the dos2Unix tool or by using the sed command as shown below: sed -i 's/\r//g' ansible_install.sh

Host FQDN error For example: "Error: release pcc- helmcharts failed: Ingress.extensions \"pcc- helmchartsmstrdataadapterserver\" is invalid: sec.rules[0].host: Invalid value: \"172.26.20.55\": must be a DNS name, not an IP address"	This error may occur when configuring and deploying CX Insights	To resolve this error, you must check for the host DNS. If the mentioned host is an IP address, then change the host IP to host FQDN. For example: Instead of 123.45.67.890 IP address use pxx-kxx-cx.domainxxx.com (server.domain.com).
K3s server start error For example: FAILED!=> {"changed": false, "msg": "Unable to restart service K3s: Failed to restart k3s.service: Connection timed out\nsee system logs and 'systemctl status k3s.service' for details.\n"}	This error may occur when configuring and deploying CX Insights	To resolve this error, re-run the following command: sudo ansible-playbook vault-id cxinsights@prompt -i inventory.yml site_upgrade.yml -K
<pre>Wrong pcon-mstr folder path error For example: FAILED!=> {"changed": false, "cmd": ["helm", "install", "pcon-mstr", "name", "pcc-hemcharts", " namespace", "pcn-cxinsights-system", "tiller- namespace", "pcn-tiller-system", "-f", "~/values.yml"], "delta": "0:0:00.166113", "end": "2020-02-21 06:47:47.533577", "failed_when_result": true, "msg": "non-sero return code", "rc": 1, "start": "2020-02-21 06:47:47.367464", "stderr": "Error: failed to download \"pcon-mstr\" (hint: running 'helm repo update' may help)", "stderr_lines": ["Error: failed to download \"pcon-mstr\" (hint: running 'helm repo update' may help)"], "stdout": "", "stdout_lines": []}</pre>	This error may occur when configuring and deploying CX Insights	To resolve this error, check for the pcon- mstr folder path. It should be in cxinsights-playbook- k3s/group_vars/all.yml upstream_chart value path.
Pods evicted state error	This error may occur when configuring and deploying CX Insights	Sometimes many pods are in an evicted state. To remove all the evicted pods, use these commands. Prerequisites: yum install jq kubectl get pods -Aall- namespaces -o json jq '.items[] select(.status.reason!=null) select(.status.reason contains("Evicted")) "kubectl delete pod \(.metadata.name) -n \ (.metadata.namespace)"' xargs - n 1 bash -c

Appendix

MicroStrategy Server License Update Process

The MicroStrategy server instance that runs in the container has a pre-activated key, which is required for the operation of MicroStrategy. This pre-activated temporary key with limited life is to facilitate uninterrupted deployment and testing in the production environment. The following procedure describes the steps required to update the key.

Note: You need to request for a new license key, based on the MicroStrategy version and validity of license.

If you are a new CX Insights customer or an existing customer, renewing contract or upgrading CIC version, must check for the validity of your MicroStrategy container license and request a new license key using the prescribed license ordering process. The MicroStrategy version may or may not change for CIC release. If the MicroStrategy version change then you must raise an <u>Activation File Request</u> (AFR) for a new MicroStrategy version license key. For CIC and CX Insights version mapping view the below table.

CX Insights Version	EIC Release	MicroStrategy Version
1.0	2019 R4	10.11
1.0	2020 R1	10.11
2.0	2020 R2	10.11
3.0	2020 R3	2020
4.0	2020 R4	2020
4.0	2021 R1	2020
4.0	2021 R2	2020

License Ordering Process

The license ordering process is taken care by the Sales Engineers for customers, so the customers must contact their account executives to initiate the process. There are two types of license key models available based on the requirements of customer, you can select the best suited model. The following are the two types of license key models available.

For Perpetual model

If you have purchased the Stock Keeping Unit (SKU)/ Part Number, but was granted with the temporary file. Then you need to submit the <u>Activation File Request</u> (AFR) and communicate to Genesys Licensing Team. For more information, see <u>Request a License File</u>.

For Subscription model

If you have the subscription file, then the file is always temporary with the end date locked on the subscription date. The requests for the subscription files should include the corresponded subscription Sales Order number or a copy of the software delivery notice that includes Sale Order number.

License Request Checklist

Scenario	Request for New License
New CX Insights Customer on boarded	Yes
Existing CX Insights Perpetual Customer	Yes
Existing Perpetual Customer, who is moving to a higher MicroStrategy version due to CIC version upgrade	Yes
Existing Perpetual Customer, who is upgrading their CIC version but has the identical MicroStrategy version in both the CIC versions	No
Existing CX Insights Subscription Customer, who is renewing the contract	Yes
Existing CX Insights Subscription Customer, who is upgrading to a higher CIC version within the contract tenure but the MicroStrategy version mapped to the future CIC version is different from the existing CIC version	Yes
Existing CX Insights Subscription Customer, who is upgrading to a higher CIC version within the contract tenure but the MicroStrategy version mapped to the future CIC version is identical as the existing CIC version	No

Process of Updating new License Key

Prerequisites

• Contact your Genesys PureConnect representative to obtain a new license key.

Installing a new License Key

Edit the GCXI configmap using the command

kubectl edit configmap pcn-cxinsights-helmcharts-gcxi-config -n pcn-cxinsights-system . Update the file with the below property with the license key under the data properties as shown below and save the file.

MSTR_LICENSE: <your new license>

Please edit the object below. Lines beginning with a '#' will be ignored,
and an empty file will abort the edit. If an error occurs while saving this file w
reopened with the relevant failures.

MSTR LICENSE:

Delete the existing GCXI container using the below command.

kubectl -n pcn-cxinsights-system scale --replicas=0 deployment/pcn-cxinsights-helmcharts-gcxi Create new GCXI pod using the below commandand license key will be updated for newly created gcxi container. There is a down time of minimum 5-minutes for a new container to get up and running.

kubectl -n pcn-cxinsights-system scale --replicas=1 deployment/pcn-cxinsights-helmcharts-gcxi

License Update Verification

After the license update is done, a log file is generated. To check the log file existence do the following:

1. Type the following command to get the pods list.

Kubectl get pods -A

IAMESPACE	NAME	READY	STATUS	RESTARTS	AGE
ube-system	coredns-66f496764-s8db4	1/1	Running		55d
ube-system	helm-install-traefik-d4jr4	0/1	Completed		55d
ube-system	svclb-traefik-mwt6h	3/3	Running		55d
ocal-path-storage.	local-path-provisioner-84f4c8b584-fsm8g	1/1	Running		55d
ube-system	traefik-785ffdcbbf-whngg	1/1	Running		55d
cn-tiller-system	tiller-deploy-76cd8c74-24krp	1/1	Running		55d
cn-cxinsights-system	pcn-cxinsights-helmcharts-gcxi-postgres-5659fbdcd6-7vkmd	1/1	Running		54d
cn-cxinsights-system	pcn-cxinsights-helmcharts-gcxi-7f5c78cb65-qtsn4	1/1	Running		28d
cn-cxinsights-system	pcn-cxinsights-helmcharts-mstrdataadapteragent-659f8ddf78-wftxp	1/1	Running		26d
cn-cxinsights-system	pcn-cxinsights-helmcharts-mstrdataadapterserver-744bf74f59mzdng	1/1	Running		26d
cn-cxinsights-system	pcn-cxinsights-helmcharts-mstrconnector-5c75cb6d66-1pb6x	1/1	Running		26d

2. To go inside GCXI pod, we need to run the following command. For example, GCXI pod name is pcn-cxinsights-helmchartsgcxi-7f5c78cb65-qtsn4

kubectl exec -it pcn-cxinsights-helmcharts-gcxi-7f5c78cb65-qtsn4 bash -n pcn-cxinsights-system 3. It allows you to go inside the GCXI pod and then navigate to the logging directory, using following command.

cd /mnt/log/mstr

4. To get the list of files use the following command

ls

- 15. Please run the following command in your Cent OS /RHEL machine where CXInsights is deployed
- 16. kubectl expose deployment pcn-cxinsights-helmcharts-gcxi -type=NodePort -name=mstr-gcxi-service -n pcn-cxinsights-system
- 17. It will expose the node port to connect GCXI Server from Microstrategy Developer.

37	4				
[root@pcn-cent7-cn25 ~]# kubectl get services -A				
NAMESPACE	NAME		CLUSTER-IP	EXTERNAL-IP	PORT (S)
kube-system	kube-dns				53/UDP, 53/TCP, 9153/TCP
default	kubernetes	ClusterIP			443/TCP
kube-system	traefik	LoadBalancer		172.19.34.175	80:31800/TCP,443:31942/TCP,8080:31226/TCP
pcn-tiller-system	tiller-deploy	ClusterIP			44134/TCP
pcn-cxinsights-system	mstr-gcxi-service	NodePort	192.168.213.106		34952:32277/TCP,8080:31087/TCP

18. We need to use the Server name and port (32277 for this instance) which is exposed for 34952 port in developer to connect to the GCXI container from developer.

Date	Change
28-June-2019	Initial release
21-November-2019	Updated architecture diagram
02-December-2019	Added Configure HTTPS For Nginx topic
04-December-2019	Updated Analytics Configuration description
06-April-2020	Added Kubernetes Deployment Information
29-April-2020	Added Troubleshooting Information
04-May-2020	Updated Server Install and Upgrade Containers topics
11-June-2020	Updated Server Install and help.genesys.com links
21-July-2020	Updated CX Insights configuration in Interaction Administrator topic
17-August-2020	Updated server installation procedure, included Switchover, and Backup and Restore features
10-November-2020	Included reverse proxy configuration procedure, added RHEL support
10-February-2021	Updated Install CX Insights Server topic.
12-March-2021	Added a new topic MicroStrategy Server License Update Process
11-May-2021	Added License Update Verification Information
20-May-2021	Added additional steps to License Update Verification Information

01-September-2021	Added Internet connectivity info in prerequisites topic.	Added Internet Required info in Prerequisites topic.
11-August-2021	Added Install MicroStrategy Dev with new license, Custom status, and Data Source Config.	
01-September-2021	Added Internet connectivity info in prerequisites topic.
